thus the open circuit voltage $U_A = (10 - 6.67) = 3.33 \text{ V} = U_T$. We can thus draw an equivalent circuit (left below), with $U_T = 3.33 \text{ V}$ and $R_T = 16.67 \text{ } \Omega$. b.

In an electronic circuit, the electromagnetic problem of voltages at arbitrary points in space is typically

simplified to voltages between nodes of circuit components such as resistors, capacitors, and transistors. Figure 1.1: Voltage V_1 is the electrical potential gained by moving charge Q_1 in an electric field.

The particular solution reduces to a final condition if sources are replaced with a unit step function. All that needs to be calculated is the homogeneous step response. Then response to any complex voltage or current source can then be found through the convolution integral.
