L. Sadori, in Reference Module in Earth Systems and Environmental Sciences, 2014 Abstract. The numerous and widespread Late Glacial and postglacial terrestrial pollen records from southern Europe represent contrasting environments. They are useful for the reconstruction of vegetation dynamics and yield information about trends and rapid climate changes.

Siberia in the Late Glacial and Early Postglacial

The Late Glacial climate warming (c. 13,000â€”10,000 years ago), or Tardiglacial ("Late Glacial"), is defined primarily by the beginning of the modern warm period, in which temperatures in the Northern Hemisphere rose substantially, causing a process of accelerated deglaciation following the Last Glacial Maximum (c. 25,000â€”13,000 years ago).

Late Glacial - Wikipedia

With the advent of complete mtDNA genome sequencing, clear Palaeolithic and Mesolithic signals in Europe have been retrieved from various mtDNA clades tracing Late Glacial and postglacial expansions of populations from European refuge areas from ≈ 18 kya, albeit with the majority clustering in the postglacial ≈ 11.5 kya , , $\hat{=}$.
