Many methods in ester synthesis can also be applied to that of lactones. In one industrial synthesis of oxandrolone the key lactone-forming step is an organic reduction - esterification.

Tetrazoles are a class of synthetic organic heterocyclic compound, consisting of a 5-member ring of four nitrogen atoms and one carbon atom. The simplest is tetrazole itself, CH_2N_4 . They are unknown in nature. [citation needed]

The selective activation of one $\text{C}^{\text{sp}^3}\text{F}$ bond (single activation) of the CF_3 group on cyclopropanes was achieved for the first time. When (trifluoromethyl)cyclopropanes were treated with arenes, allylsilanes, silyl enol ethers, or hydrosilanes in the presence of Me_2AlCl , fluoride elimination and the subsequent ring opening proceeded to afford 4,4-difluorohomoallylated products.

Old target, new tricks: A total synthesis of the infamous polycyclic indole alkaloid reserpine has been accomplished. The synthetic strategy features a rationally designed internal desymmetrization process, which renders the use of a greatly simplified reserpine E ring compared to all the past syntheses.

Sodium triacetoxyborohydride is presented as a general reducing agent for the reductive amination of aldehydes and ketones. Procedures for using this mild and selective reagent have been developed for a wide variety of substrates.

Aliphatic polyethers generated by the ring-opening polymerization (ROP) of the epoxide monomers ethylene oxide (EO), propylene oxide (PO), and, to a lesser extent, butylene oxide (BO) are a highly established and important class of polymers that are commercially used for an immense variety of applications.
